# General Structure

- 1 SM Introduction
  - Introduction - Context
  
- 2 B-L-SM section

# The Standard Model - And it's unfortunate problems

- The Standard Model (**SM**) is a great **approximation**

# The Standard Model - And it's unfortunate problems

- The Standard Model (**SM**) is a great **approximation** ... but what exactly is the **SM**?

# The Standard Model - And it's unfortunate problems

- The Standard Model (**SM**) is a great **approximation** ... but what exactly is the **SM**?
- It can be described as a QFT theory that unifies the strong weak and color force.

- The Standard Model (**SM**) is a great **approximation** ... but what exactly is the **SM**?
- It can be described as a QFT theory that unifies the strong weak and color force.

However things can be more complicated than that... the full SM Lagrangian is,

$$\begin{aligned}
& -\frac{1}{2}g^2v_\mu\partial_\nu g_\mu^a - g_s f^{abc}g_\mu^a g_\nu^b g_\mu^c - \frac{1}{g_s^2}f^{abc}f^{ade}g_\mu^b g_\nu^c g_\mu^d g_\nu^e + \\

\end{aligned}$$

- 1 Gluon terms (Strong Force)
- 2 W and Z terms (Weak force )
- 3 Matter interactions with the weak force

- 4 Ghosts (related to particle propagation)
- 5 Faddeev-Popov ghosts (gauge cancellations)

- Of course this is usually shortened to it's neat, mug compatible, form,

- We do something similar and look at the SM in parts before looking at exactly these expressions represent.

# Fields/Structure/HiggsVEV

The SM is invariant under,

$$\mathcal{G}_{SM} = \text{SU}(3)_C \times \text{SU}_L \times \text{U}_Y. \quad (1)$$

something

$$H = \begin{pmatrix} \phi_1 + i\phi_2 \\ v + h + i\phi_3 \end{pmatrix} \rightarrow \langle H \rangle = \frac{1}{\sqrt{2}} \begin{pmatrix} 0 \\ v + h \end{pmatrix}.$$

Figure: Higgs Mechanism

# Gauge Terms and Bosons

The portion of the Lagrangian that is of most import to the gauge bosons is,

$$\begin{aligned}\mathcal{L}_{kin} = & -\frac{1}{4}G_a^{\mu\nu}G_{a\mu\nu} - \frac{1}{4}A_a^{\mu\nu}A_{a\mu\nu} - \frac{1}{4}B^{\mu\nu}B_{\mu\nu} \\ & - i\bar{Q}_{L_i}\not{D}Q_{L_i} - i\bar{u}_{R_i}\not{D}u_{R_i} - i\bar{d}_{R_i}\not{D}d_{R_i} - i\bar{L}_{L_i}\not{D}L_{L_i} - i\bar{e}_{R_i}\not{D}e_{R_i} \quad (2) \\ & - (D_\mu H)^\dagger(D^\mu H),\end{aligned}$$

This is before the Higgs mechanism gets in full effect. Being that the generation of mass comes from the interactions with the Higgs, we find the following terms,

$$m_V^2 = \frac{v^2}{4} \begin{pmatrix} g^2 & 0 & 0 & 0 \\ 0 & g^2 & 0 & 0 \\ 0 & 0 & g^2 & -gg_Y \\ 0 & 0 & -gg_Y & g_Y^2 \end{pmatrix}, \quad (3)$$

so we move to a eigenbasis,

$$\begin{pmatrix} A_\mu^1 & A_\mu^2 & A_\mu^3 & B_\mu \end{pmatrix} \quad (4)$$

$$\begin{pmatrix} A_\mu^3 & B_\mu \end{pmatrix} \cdot \frac{1}{2}v^2 \begin{pmatrix} g^2 & -gg' \\ -gg' & g'^2 \end{pmatrix} \cdot \begin{pmatrix} A^{\mu,3} \\ B^\mu \end{pmatrix}, \quad (5)$$

# Differences given the fields

## Motivations for $B - L$ (Baryon number minus Lepton number) symmetry:

- The SM contains an accidental symmetry that conserves  $B - L$ ,
- $B - L$  symmetry relevant for baryogenesis through leptogenesis,
  - sphaleron process violates  $B$  but preserves  $B - L$
- Grand Unified Theories, e.g.  $SO(10)$ ,  $E_6$ ,  $E_8, \dots$  contain gauged  $U(1)_{B-L}$ ,
- The scale of  $U(1)_{B-L}$  breaking sets the mass scale of the right-handed Majorana neutrinos.

- Model contains an extra  $Z'$  gauge boson [Basso, Belyaev, Moretti, Pruna: JHEP 0910 \(2009\) 006](#) ; [Basso, Belyaev, Moretti, Shepherd-Themistocleous: Phys.Rev. D80 \(2009\) 055030](#)

## R1

$$\begin{pmatrix} h_1 \\ h_2 \end{pmatrix} = \begin{pmatrix} \cos \alpha_h & -\sin \alpha_h \\ \sin \alpha_h & \cos \alpha_h \end{pmatrix} \begin{pmatrix} h \\ h' \end{pmatrix}$$

**Heavy  $Z'$  implies that  $x \gg v$  for most of the parameters points:**

$$\sin \alpha_h \approx \frac{1}{2} \frac{\lambda_3}{\lambda_2} \frac{v}{x} \quad m_{h_1}^2 \approx 2\lambda_1 v^2 \quad m_{h_2}^2 \approx 2\lambda_2 x^2$$

## Kinetic mixing

$$\mathcal{L}_{\text{bosons}} = |D_\mu H|^2 + |D_\mu \chi|^2 - V(H, \chi) - \frac{1}{4} F_{\mu\nu} F^{\mu\nu} - \frac{1}{4} F'_{\mu\nu} F'^{\mu\nu} - \frac{1}{2} \kappa F_{\mu\nu} F'^{\mu\nu}$$

- $\kappa$  is a  $\text{U}(1)_Y \times \text{U}(1)_{\text{B-L}}$  gauge kinetic-mixing parameter
- Field strength tensors  $F_{\mu\nu} = \partial_\mu A_\nu - \partial_\nu A_\mu$  and  $F'_{\mu\nu} = \partial_\mu A'_\nu - \partial_\nu A'_\mu$
- Redefine  $\kappa = \sin \alpha$  and gauge fields as (convenient basis choice)

$$\begin{pmatrix} A_\mu \\ A'_\mu \end{pmatrix} = \begin{pmatrix} 1 & -\tan \alpha \\ 0 & \sec \alpha \end{pmatrix} \begin{pmatrix} B_\mu \\ B'_\mu \end{pmatrix},$$

# Yukawa sector

$$\mathcal{L}_{\text{Yukawa}} = -y_u^{ij} \overline{q_{Li}} u_{Rj} \tilde{H} - y_d^{ij} \overline{q_{Li}} d_{Rj} H - y_e^{ij} \overline{\ell_{Li}} e_{Rj} H - y_\nu^{ij} \overline{\ell_{Li}} \nu_{Rj} \tilde{H} - \frac{1}{2} y_M^{ij} \overline{\nu_{Ri}^c} \nu_{Rj} \chi +$$

- $\tilde{H} = i\sigma^2 H^*$
- Dirac and Majorana masses matrices:  $m_D = \frac{y_\nu}{\sqrt{2}} v$  and  $M = \frac{y_M}{\sqrt{2}} x$
- Neutrino masses via see-saw mechanism:  $\begin{pmatrix} 0 & m_D \\ m_D & M \end{pmatrix} \rightarrow \begin{cases} m_{\nu_l} \approx \frac{m_D^2}{M} \\ m_{\nu_h} \approx M \end{cases}$
- Small mixing angle:  $\tan \alpha_\nu \approx -2\sqrt{\frac{m_{\nu_l}}{m_{\nu_h}}}$
